# On Some Properties of Alfa Sets

Belal K. Nairat Applied Sciences Private University, Amman, Jordan

**Abstract:** In this study, we introduce and study the concepts of  $\alpha$ -open set,  $\alpha$ -continuous functions then, we also study the concepts of  $\alpha$ -compact subsets and study some new characterizations of  $\alpha$ -connectedness. Then we discuss the relations between the  $\alpha$ -continuous functions and these concepts.

**Key words:**  $\alpha$ -open set,  $\alpha$ -compact,  $\alpha$ -open cover,  $\alpha$ -closed sets,  $\alpha$ -continuous, concepts

### INTRODUCTION

Generalized open sets play a very important role in general topology and they are now the research topics of many topologists worldwide. In this study, we discuss the properties of  $\alpha$ -sets and  $\alpha$ -continuous functions. All through this study  $(X, \tau)$  and  $(Y, \sigma)$  stand for topological spaces with no separation assumed, unless otherwise stated. The closure of A and the interior of A will be denoted by Cl(A) and Int(A), respectively.

### MATERIALS AND METHODS

**Preliminaries; Definition 3.1:** A subset A of a space X is said to be (Andrijevic, 1996; Mustafa, 2005; Calads and Jafari, 2003; Crossley and Hildebrand, 1971; Dugundji, 1996; El-Deeb *et al.*, 1983; Levine, 1963; Maheshwari and Prasad, 1972):

- Semi-open if  $A\subseteq Cl(Int(A))$
- Pre open if A⊆Int(Cl(A))
- $\alpha$ -open if  $A\subseteq Int(Cl(Int(A)))$

**Definition 3.2:** A function f: X→Y is called (Al-Obiadi, 2005; Mashhour *et al.*, 1982):

- Semi continuous if f¹(V) is semi open in X for each open set V of Y
- Pre continuous if f<sup>1</sup>(V) is pre open in X for each open set V of Y
- $\alpha$ -continuous if  $f^1(V)$  is  $\alpha$ -open in X for each open set V of Y

**Definition 3.3;Mustafa (2005):** A space X is a  $\alpha$ -T<sub>2</sub> space iff for each x,  $y \in X$  such that  $x \neq y$  there are  $\alpha$ -open sets U,  $V \subset X$ , so that,  $x \in U$ ,  $y \in V$  and  $U \cap V = \emptyset$ .

### α-connectedness

**Definition:** A space which is a union of two disjoint non-empty  $\alpha$ -open sets is called  $\alpha$ -disconnected.

**Equivalently:** A space X is  $\alpha$ -connected f the only subsets of X which are both  $\alpha$ -open and closed are  $\varnothing$  and X.

**Proof of equivalence:** If  $X = A \cup B$  with A and B  $\alpha$ -open and disjoint then X-A = B and so, B is the complement of an  $\alpha$ -open set and hence, is  $\alpha$ -closed. Similarly, B is clopen.

Conversely, if A is a non-empty, proper open subset then A and X-A  $\alpha$ -disconnect X. A subset of a topological space is called  $\alpha$ -connected if it is connected in the subspace topology.

**Theorem:** The  $\alpha$ -continuous image of a  $\alpha$ -connected space is  $\alpha$ -connected.

**Proof:** If  $f: X \rightarrow Y$  is  $\alpha$ -continuous and  $f(X) \subset Y$  is  $\alpha$ -disconnected by  $\alpha$ -open sets U, V in the subspace topology on f(X) then the  $\alpha$ -open sets f-1(U) and f-1(V) would  $\alpha$ -disconnect X.

**Corollary:**  $\alpha$ -connectedness is preserved by homeomorphism.

**Theorem:** If A and B are  $\alpha$ -connected and  $A \cap B \neq \emptyset$  then  $A \cup B$  is  $\alpha$ -connected.

**Proof:** Suppose  $\alpha$ -open sets U and V  $\alpha$ -disconnect  $A \cup B$ . Then  $A \cap U$  and  $A \cap B$  would  $\alpha$ -disconnect A and so, one of them is  $\varnothing$ . So, suppose  $A \subset U$ . Similarly we have either  $B \subset V$  or  $B \subset U$ . Since, B meets A the first of these is impossible and so, we have  $A \cup B \subset U$  and  $V = \varnothing$ .

## RESULTS AND DISCUSSION

## Covering properties

**Definition 5.1:** Let  $\{G_\alpha\colon \alpha\epsilon\Delta\}$  be a family of  $\alpha$ -open sets of the space X. The family  $\{G_\alpha\colon \alpha\epsilon\Delta\}$  covers X if  $X\subseteq\bigcup_i G_\alpha$ .

**Definition 5.2:** A space X is called a  $\alpha$ -compact space if each  $\alpha$ -open cover of X has a finite subcover for X.

**Theorem 5.3:** Let A be a  $\alpha$  -compact subset of the  $\alpha$ -T<sub>2</sub> space X and  $\notin$ A. Then there exist two disjoint  $\notin$ -open sets U and V containing x and respectively.

**Proof:** Let  $y \in A$ , since, X is  $\alpha - T_2$  space there exist two  $\alpha$ -open sets  $U_x$ ,  $V_y \in X$  such that  $x \in U_x$ ,  $y \in V_y$ ,  $U_x \cap V_y = \varphi$  the family is open cover of A has a finite subcover, thus:

**Theorem 5.4:** If X is  $\alpha$ -T<sub>2</sub> space and A is a  $\alpha$ -open subset, if A is  $\alpha$ -compact then A is a  $\alpha$ -closed.

**Proof:** Let  $x \in X$ -A, by the theorem 4.3 there exist two  $\alpha$ -open sets U and V such that  $X \in U$ ,  $A \subseteq V$ ,  $U \cap V = \varphi$ , thus,  $x \in U \subseteq X$ -V  $\subseteq X$ -A which implies X-A is  $\alpha$ -open, so that, A is  $\alpha$ -closed.

**Theorem 5.5:** Let A and B be a two  $\alpha$ -compact subsets of the  $\alpha$ -T<sub>2</sub> space X then there exist disjoint  $\alpha$ -open sets U and V containing A and receptively.

**Proof:** Let beB, since, A is a  $\alpha$ -compact subset and  $\alpha$ -open in X there exist two  $\alpha$ -open sets  $U_b$ ,  $V_b$  such that  $U_b \cap V_b = \varphi$ ; beV<sub>b</sub>, A $\subseteq$ U<sub>b</sub>, so,  $\beta = \{B \cap V_b; b \in B\}$  is a  $\alpha$ -open cover of B, since, B is  $\alpha$ -compact subset there exist finite subcover  $\{B \cap V_{in}; 1 \le i \le n\}$  from  $\beta$ . Let:

$$U = \bigcap_{i=1}^{n} U_{b_i}, V = \bigcup_{i=1}^{n} V_{b_i}$$

Thus:

$$A \subseteq U, B \subseteq V, U \cap V = \phi$$

**Theorem 5.6:** Let  $f: (X, \tau) \rightarrow (Y, \rho)$  be a  $\alpha$ -continuous surjection open function, if X is a  $\alpha$ -compact then Y is a  $\alpha$ -compact.

**Proof:** Let  $\beta = \{V_{\alpha}: \alpha \in \Delta\}$  be a  $\alpha$ -open cover of Y, then  $L = \{f^1(V_{\alpha}): \alpha \in \Delta\}$  is a  $\alpha$ -open cover of X. Since, X is a  $\alpha$ -compact space there exist a finite subcover from L to the space X. Such that:

$$X \subseteq \bigcup_{i=1}^{n} f^{-1}(V_{\alpha i})$$

Thus:

$$Y = f\left(X\right) \subseteq f\left(\bigcup_{i=1}^n f^{\text{-}1}\!\left(V_{\alpha,i}\right)\right) = f\left(f^{\text{-}1}\!\!\left(\bigcup_{i=1}^n\!\!\left(V_{\alpha,i}\right)\right)\right) = \bigcup_{i=1}^n\!\!\left(V_{\alpha,i}\right)$$

Hence:

$$Y \subseteq \bigcup_{i=1}^{n} (V_{\alpha i})$$

This shows Y is a  $\alpha$ -compact.

Corollary 5.7:  $\alpha$ -compactness is a topological property

**Proof:** The proof from Theorem 4.5.

**Definition 5.8:** A family of sets  $\beta$  has "finite intersection property" if every finite subfamily of  $\beta$  has a nonempty intersection.

**Theorem 5.9:** A topological space is  $\alpha$ -compact if and only if any collection of its  $\alpha$ -closed sets having the finite intersection property has non-empty intersection.

**Proof:** Suppose X is  $\alpha$ -compact, i.e., any collection of  $\alpha$ -open subsets that cover X has a finite collection that also cover X. Further, suppose  $\{G_{\alpha}: \alpha \in \Delta\}$  is an arbitrary collection of  $\alpha$ -closed subsets with the finite intersection property. We claim that:

$$\bigcap_{\alpha \in \Lambda} G_{\alpha} \neq \emptyset$$

Is non-empty. Suppose otherwise, i.e., suppose:

$$\bigcap_{\alpha \in \Lambda} G_{\alpha} = \emptyset$$

Then:

$$\bigcup_{\alpha \in \Delta} (X \text{-} G_{\alpha}) = X \text{-} \left(\bigcap_{\alpha \in \Delta} G_{\alpha}\right) = X \text{-} \varphi = X$$

Since, each  $G\alpha$  is  $\alpha$ -closed, the collection  $\{X - G_{\alpha}: \alpha \in \Delta\}$  is an  $\alpha$ -open cover for X. By compactness there is a finite subcover L such that:

$$X = \bigcup_{i=1}^{n} (X - G_{\alpha_i})$$

But then:

$$\bigcap_{i=1}^n G_{\alpha_i} = \bigcap_{i=1}^n \Bigl( X - \Bigl( X - G_{\alpha_i} \Bigr) \Bigr) = X - \Biggl( \bigcup_{i=1}^n \Bigl( X - G_{\alpha_i} \Bigr) \Biggr) = X - X = \varphi$$

which contradicts the finite intersection property of  $\{G_{\alpha}: \alpha \in \Delta\}$ . Conversely, take the hypothesis that every family of a  $\alpha$ -closed sets in X having the finite intersection

property has a nonempty intersection. We are to show X is  $\alpha$ -compact. Let  $\{G_{\alpha}: \alpha \in \Delta\}$  be any  $\alpha$ -open cover of X. Then  $\{X \ G_{\alpha}: \alpha \in \Delta\}$  is a family of  $\alpha$ -closed sets such that:

$$\bigcap X - G_{\alpha} = X - \left( \bigcup_{\alpha \in \Delta} G_{\alpha} \right) = X - X = \emptyset$$

Consequently, our hypothesis implies the family  $\{X-G_\alpha: \alpha \in \Delta\}$  does not have the finite intersection property. Therefore, there is some finite subcollection  $\{X-G_\alpha: i=1,2,3,...,n\}$  such that:

$$\bigcap_{i=1}^{n} X - G_{\alpha_{i}} = \phi$$

And hence:

$$X = \bigcup_{i=1}^n G_{\alpha_i} = \bigcup_{i=1}^n \Bigl( X - \Bigl( X - G_{\alpha_i} \Bigr) \Bigr) = X - \Biggl( \bigcap_{i=1}^n \Bigl( X - G_{\alpha_i} \Bigr) \Biggr) = X - \varphi = X$$

Thus:

$$X\!=\!\bigcup_{i=1}^n\!G_{\alpha_i}$$

Implying X is α-compact.

### CONCLUSION

In this study, the relations between the  $\alpha$ -continuous functions and their concepts are discussed clearly.
